## 1 Chapter 1: Introduction

The following chapter will discuss the concept of our project, StoryLense. We will elaborate on the issue that is facing modern movie rating sites, the solution we are going to offer, and the general vision, goals, and scope of our product. The chapter provides a background on the reason why the system is required and the objectives it is supposed to accomplish.

Watching a good movie has a certain timeless quality. Revisiting a beloved one and discovering nuances overlooked during the initial viewing—or experiencing a familiar scene in a new way as you grow older—can be even more powerful. Over time, our interpretation of films evolves alongside our personal growth, experiences, and emotional maturity. The same movie that once made us laugh might evoke nostalgia years later, and a story that felt ordinary during youth may become profound with experience. Cinema, therefore, is not merely entertainment; it is a mirror that reflects the shifting lenses through which we view life.

Despite this richness of cinematic experience, most existing film platforms treat every viewing as identical, resulting in a static and impersonal user experience. Popular rating systems, for instance, typically allow only a single rating or review per film, assuming that perception is constant. This simplification fails to capture the fluid nature of human emotion and taste, turning what should be a reflective process into a one-time interaction. User shelves and watchlists, too, function as static checklists rather than living representations of a person’s evolving preferences. As a result, the dynamic connection between viewers and art is lost, and the potential for meaningful introspection through media consumption remains largely unexplored.

Our proposed solution addresses this core issue by developing StoryLense, a movie rating platform designed to capture the evolving relationship between people and the films they love. StoryLense is built on the principle that personal perception is never fixed. It allows users to rate the same movie differently with each viewing, effectively transforming the rating process into a timeline of emotional growth. This reimagined model not only personalizes the viewing experience but also provides users with insights into how their opinions, moods, and preferences have developed over time. Moreover, StoryLense introduces a time-based filtering feature that enables users to discover movies according to their available viewing duration—whether they have a brief pause in their day or an extended

evening for leisure. This small yet impactful addition makes the experience more convenient, intentional, and user-centered.

The relevance of such a system becomes clear in the current digital landscape. The explosion of online streaming services has radically changed how audiences engage with visual media. Recent statistics show that 89% of consumers worldwide watch broadcast TV daily, while 76% watch online streaming content. On average, people spend approximately 1 hour and 22 minutes per day watching online media and 1 hour and 47 minutes watching traditional broadcast TV [1]. These numbers highlight how deeply film and television have become intertwined with everyday life. However, while the accessibility of movies has improved dramatically, personalization in film evaluation and reflection has not kept pace. StoryLense responds to this gap by prioritizing emotional intelligence and human-centered design within the digital entertainment space.

From a broader perspective, StoryLense aims to combine technology with empathy—creating a bridge between user data and human emotion. It supports not only movie enthusiasts but also casual viewers who wish to make sense of their changing tastes over time. The project’s emphasis on adaptive rating, reflective journaling, and dynamic shelves contributes to an era of personalized digital experiences, where technology doesn’t just serve function but enhances self-understanding. In this way, StoryLense aligns with modern trends in artificial intelligence, recommendation systems, and digital well-being, promoting a deeper and more mindful engagement with media consumption.

This project also holds academic and practical value, as it highlights how systems design can evolve beyond utility to foster introspection and cultural appreciation. It demonstrates that user interaction models can go beyond traditional static frameworks, embracing flexibility and personal narrative as integral parts of the user experience. By doing so, StoryLense challenges conventional notions of data-driven systems and redefines what it means for technology to be truly user-oriented.

To guide the reader through the development of StoryLense, this report is structured into several chapters. Chapter 2 provides a domain analysis of current movie rating platforms, identifying their limitations and clarifying the niche StoryLense seeks to fill. Chapter 3 details the requirements engineering process, including data collection through interviews and questionnaires, and establishes both the functional and non-functional requirements of the system. Chapter 4 outlines the system design and development, explaining its architecture, data flow, and implementation plan. Chapter 5 evaluates the system’s performance and assesses its ability to meet user needs and expectations. Finally, Chapter 6 concludes the report by summarizing findings, reflecting on the overall contribution of the project, and suggesting potential directions for future enhancement.

## 1.1 The Problem

In the world of online film databases, a persistent and systemic issue faced by movie enthusiasts is the static and rigid nature of user profiles and film ratings. Most existing platforms, including major services like IMDb and Letterboxd, treat a user's cinematic taste as a fixed entity, assuming that once a film is rated, that opinion remains constant forever. This is a critical failure point, as market data confirms that a user's preferences evolve over time—shaped by age, mood, and life experiences—leading to a user's opinion frequently changing upon revisiting a film. This inflexibility is a significant problem because, as industry research consistently shows, a large segment of the market finds that a single, static rating does not accurately capture their evolving relationship with a movie. Because existing platforms offer no mechanism to meaningfully capture this change, users are forced to choose between keeping their initial rating or overwriting it, thereby rendering their profile an inaccurate and inflexible record of their true tastes. This failure to adapt also results in user frustration with the lack of integrity in overall ratings, often perceived as "biased towards the actors" or influenced by star power rather than film quality.

Furthermore, users often face the burden of inefficient content discovery due to a lack of practical utility features aligned with real-world constraints. For instance, a user attempting to find a film for a quick evening watch is hampered by the inability to efficiently filter content by duration. The resulting friction in the search process highlights a fundamental market gap, as preliminary requirements gathering has identified time-based filtering as a highly valued and essential utility. This market data confirms that the problem is not isolated but is a prevalent issue affecting user experience. This lack of flexibility in tracking evolving opinions and the inefficiency in searching for time-sensitive content demonstrates a clear gap in the market that StoryLense is designed to fill.

## 1.2 The Solution

"StoryLense" is designed to facilitate smoother experiences for users by directly addressing the problem of lack of flexibility and static film platforms by providing a more dynamic and personalized user experience.

The website offers two key features. First, a rating system that allows users to provide separate ratings for their initial and repeat viewings of a film. Second, a duration-based search filter enables users to quickly and efficiently find a movie that fits their available time. All of this is facilitated through a

personalized "shelf", which acts as a dynamic collection of a user's favorite and watched films, evolving alongside their viewing history rather than remaining a simple, static checklist.

Consequently, all user information and personal shelves will be securely stored in their accounts, ensuring easy access all times!

The benefits of this solution are significant. StoryLense provides a more authentic and reflective experience for users to accurately document their journey.

## 1.3 The Product

### 1.3.1 Product Vision

For movie enthusiasts who are frustrated by the impersonal nature of traditional rating websites and seek a personalized and evolving rating experience, StoryLense is a movie rating website that provides a dynamic and evolving record of their cinematic journey. Unlike platforms like IMDb, our product stands out by offering a multi-rating feature and duration-based filtering, allowing users to accurately reflect their changing tastes and find the perfect film for any moment. Ultimately, our vision is to ensure an experience that is not only personalized for users but also more adaptive to changing preferences.

### 1.3.2 Product Roadmap

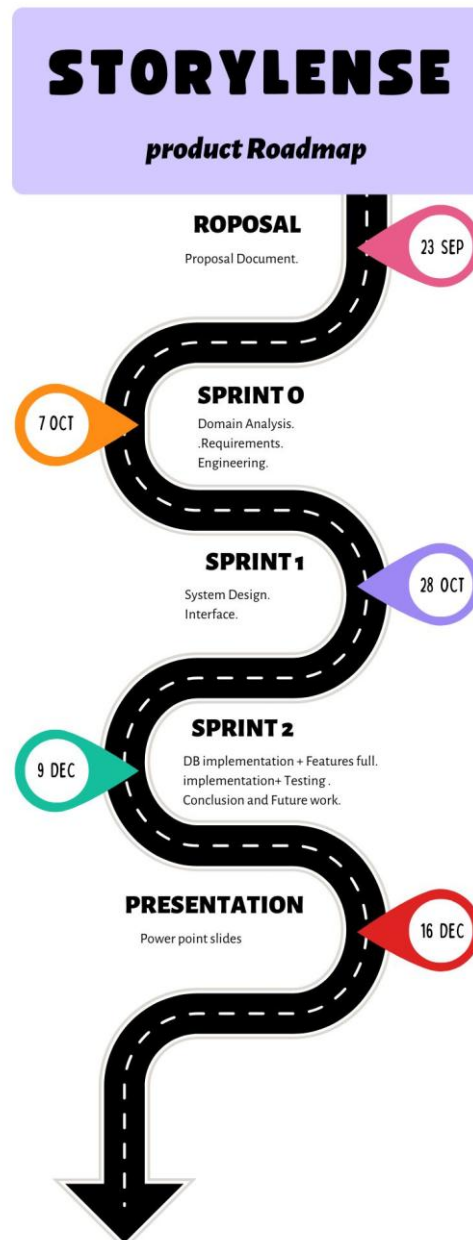

Figure 1 :Product Roadmap

### 1.3.3 Objectives

- **Product (customer focus-value):**

For film enthusiasts, StoryLense website provides a personalized platform that evolves with the users, including allowing them to do the following features:

- Create and manage a personal account.
  - Search for a movie and view its details.
  - Add watched movies to a personal shelf and remove them if needed.
  - Rate movies out of 5 stars and edit the rating if needed.
  - Enabling a multi rating system allows users to provide separate ratings for their initial and repeat viewings of a film.
  - Provide filtering results based on film duration.
- **Project (solution focus-plan):**

To complete our project, we need to follow the fundamental stages of the software development process, which include:

- Conducting interviews and questionnaires.
  - Domain analysis.
  - Design website GUI.
  - Develop and implement features in the website.
  - Create a database for the website.
  - Test website.
- **Learning (student focus):**

Upon completing this project, we will have significantly enhanced our understanding of various tools and methodologies, including:

- Design and implement a database for user information and movie data.
- Data analysis, user research, and application testing.
- Using new programming tools (e.g.: VScode, git).
- Improve web development skills.
- Document an application's development process.

## Scope

"StoryLense" website is designed to help users track and rate movies they have watched. It will be developed to support English language, and its functionality will allow users to create an account, log in, and log out. They will have the ability to search for a movie and view its plot summary and a list of the cast, then rate the film, and add it to watched movie shelf, users also could remove movies from shelves and edit ratings for flexibility. A core feature of StoryLense is the ability for users to rate movies multiple times, and filter movies based on time duration, however, there will be some limitation on the database's size and on social features such as following other users or a community-wide review section.

### 1.4 The Scrum Team

| <b>Scrum Master (SM)</b> | Reem Alqifari                                                                              |
| <b>Stakeholders</b>      | Reem Alqifari                                                                              |

Table 1: The Scrum Team

## 2 Chapter 2: Domain Analysis

The following chapter will discuss the history of the current movie rating systems, examine related sites, such as IMDb and Letboxd, and discuss their shortcomings. We are also going to describe how StoryLense is going to be used within this sphere and what makes it unique among its competitors. This discussion assists in determining the incentive and reason why we should develop our system.

### 2.1 Background

Movie rating systems are widely used digital platforms that allow users to record, evaluate, and organize their viewing experiences. These systems play a major role in helping audiences share opinions, discover popular films, and keep track of what they have watched. A rating system usually enables users to assign numerical or symbolic values (such as stars) to express their level of satisfaction with a movie. Such ratings contribute to a collective understanding of audience preferences and can influence movie popularity and future viewing decisions.

Based on this, our project StoryLense aims to develop an interactive and user-friendly web platform that improves the movie rating and organization experience through innovative features, including:

- **Dual Rating:** Allows users to record two separate ratings for each movie (after the first watch and after rewatching) to measure how opinions change over time.
- **Runtime-Based Filtering:** Categorizes movies into time ranges ( $\leq 60$  minutes, 61–120 minutes,  $> 120$  minutes) to help users select a movie that fits their available time.

The design of movie rating websites also relies heavily on key principles of User Experience (UX) and Interface Design, ensuring that systems remain intuitive, accessible, and visually appealing. Elements such as search functionality, shelf or list management, and rating interfaces are developed to enhance usability and encourage continuous user engagement. On the technical side, our platform employs web technologies such as HTML, CSS, and JavaScript for interface implementation, and MySQL databases to store user accounts, ratings, and movie data securely.

Furthermore, maintaining data accuracy and user privacy is essential in rating platforms. Proper data management ensures that users' feedback and profiles remain consistent across sessions, while security measures such as encrypted connections and restricted data access safeguard personal information.

In summary, movie rating systems serve as interactive tools that combine entertainment, user interaction, and data organization. Understanding their structure, functionality, and technical foundations provides the necessary background for developing any modern web-based movie evaluation platform.

## 2.2 Literature Review

Before we develop our website, it is important to look into other competitors to understand their strengths and weaknesses and know how we can develop our idea to be different and better.

**Competitor 1: IMDb [2]:** website/application where users can search for movies, see cast information, ratings, reviews, and watch trailers.

- **Strengths:**

1. Very large database with millions of movies, TV shows, and actors' information.
2. Provides user reviews and average rating system.
3. Offers movie details like cast, release date, genre, and trivia.

- **Limitations:**

1. Rating system is static – users cannot rate a movie more than once.
2. Interface looks outdated compared to modern platforms.
3. Does not provide a duration filter to choose movies by time length.

**Competitor 2: Letterboxd [3]:** social platform for movie lovers where users can log films they watch, write reviews, and follow other users.

- **Strengths:**

1. It allows users to create lists of movies and share them.

2. Provides community by offering features such as following friends, likes, and comments.
3. Simple and modern design for movie reviews and ratings.

- **Limitations:**

1. Users can only give one rating for each movie (no multiple ratings for repeat watching).
2. The free version has limited features (some tools require a paid account).

| Feature                          | IMDb | Letterboxd | StoryLense<br>(Our Website) |
|----------------------------------|------|------------|-----------------------------|
| Multi-rating system.             | X    | X          | ✓                           |
| Duration-based filter.           | X    | ✓          | ✓                           |
| Large database of movies.        | ✓    | ✓          | X (smaller at first)        |
| Social features (follow, likes). | X    | ✓          | X                           |

Table 2: Comparison of Competitor Systems & Proposed System

From this analysis, we see that *StoryLense* is unique compared to IMDb and Letterboxd. Both competitors focus on general movie ratings and reviews, but they do not allow a user to add new ratings when their opinion changes over time. Also, IMDb does not support filtering movies by duration, which is important for users who have limited time. *StoryLense* provides a dynamic shelf that evolves with the user's taste, offers multiple ratings for the same movie, and includes a smart duration filter. These features make our product more personal and flexible than the existing platforms.

### 3 Chapter 3: Requirements Engineering

The following chapter explains the process of how the system requirements of *StoryLense* were gathered and discussed. It also gives the methods of identifying the needs of the user like interviews and questionnaires and the nature of the users who will be interacting with the system. It also specifies the functional and non-functional requirements, where the system is defined in terms of what it is supposed to do and what it is supposed to offer.

#### 3.1 Requirements Elicitation & Analysis

To collect the requirements for *StoryLense*, we used two main methods: user interviews and questionnaires. These helped us understand how people watch movies, how they search for them, and what features are missing in existing platforms.

We conducted 5 interviews with students and young adults who watch movies regularly. The interviews were semi-structured and open-ended, so participants could explain their habits and frustrations in detail. From these interviews, we learned that many users re-watch movies and sometimes want to change their ratings after the second watch. Another important finding was that users want to find movies that fit their available time, for example short movies when they are busy.

In addition, we created an online questionnaire and shared it with different people. We collected 43 valid responses. The results gave us a broader picture of user needs. Most participants watch movies often, and many of them use social media or friends' recommendations or depend on cast members to discover new titles. A large percentage said they have changed their opinion of a movie after a rewatch. The questionnaire also confirmed that duration filters are important for people who don't have much free time.

During requirements elicitation, we also looked at existing systems (IMDb and Letterboxd) to analyze their strengths and weaknesses. These systems helped us understand what features users already expect, and where our system can be different, such as allowing multiple ratings for the same movie.

In summary, by combining interviews, questionnaire results, and analysis of similar platforms, we were able to identify clear requirements for *StoryLense*. The details of the interview questions and questionnaire are available in the Appendix section.

### 3.1.1 Interviews

#### - Participants' information

| Participants Name   | Age | Nationality | Gende  | Scope of work                                                                                                                 |
|---------------------|-----|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------|
| Aryam Abdullah      | 21  | Saudi       | Female | Student interested in movie analysis and user experience.                                                                     |
| Mohammed Al-Qahtani | 22  | Saudi       | Male   | A university student who enjoys exploring film ratings and reviewing platforms.                                               |
| Sara Alotaibi       | 30  | Saudi       | Female | Short-Form Content creator: Prioritizes quick, time-efficient viewing; highly values instant utility features like filtering. |
| Omar Talal          | 27  | Saudi       | Male   | Film Analyst / Avid Reviewer: Frequent user of online databases for detailed film analysis and rating                         |
| Mariam Saleh        | 29  | Saudi       | Female | Casual Planner & List Manager: Primarily uses platforms to organize watchlists ("shelf")                                      |

|  |  |  |  |                                           |
|--|--|--|--|-------------------------------------------|
|  |  |  |  | management) and coordinate group viewing. |

Table 3: Participants Information

## -Results and findings of interview.

This section provides a summary of the key findings of the interviews that were conducted ([full transcripts are provided in Appendix \[A\]](#)). The responses of the participants were examined as a group, and the findings are presented in the form of questions to highlight the common themes, variations, and important lessons.

### 1st Question: What is your general decision making process when it comes to watching a movie?

Participants repeatedly stated that mood is an important factor in their decisions. Some interviewees indicated that they watch light and fun films when they are tired, and others watch deep or emotional films when they are in the right state of mind. Friends and trusted sources were also popular in making recommendations, as well as trailers, reviews, or platform trends. Others identified certain directors or peer groups as powerful influences. In general, the process of making decisions is a combination of personal mood and external influence, and there is a slight bias in favor of personal recommendations in comparison with generic platform recommendations.

### 2nd Question: Have you ever felt that after viewing a movie more than once you changed your opinion about it?

The five participants all agreed that rewatching tends to alter their view. Examples were *Interstellar* and *A.I. Artificial Intelligence*, where the second watch made the underlying themes or new information that changed the first impressions. Other interviewees reported that movies that initially seemed confusing or boring ended up being favorites on a second viewing. This demonstrates that viewers appreciate the fact that they can update or append several ratings, as opinions do change with repeated viewing.

**3rd Question: Do you think having your own shelf to store and categorize your favorite or to-watch movies would be helpful? Why or why not?**

All the participants were very much in favor of the concept of a personal shelf. Some of them stressed its usefulness in remembering recommendations, tracking watched titles, and sorting movies by taste. One of the interviewees emphasized the frustration with watchlists being distributed across various platforms and desired a centralized watchlist, or meta-watchlist. Others indicated that this would be a feature that would enable organization as well as self-expression. This means that there is high demand of a personalized, customizable movie shelf feature.

**4th Question: In selecting a movie, what is the importance of the movie length in your selection?**

There was a difference in opinion over the duration but it was usually contextual. Others indicated that length was not important as long as the story was interesting to them, but others indicated that runtime was a significant factor when time was of the essence. Some of them said that they watched short films or episodes on weekdays and watched the long movies on weekends. One interviewee even established a certain time limit (approximately 105 minutes) to spontaneous viewing. On the whole, the length of the movie is not necessarily the determining factor, but it has a direct impact on the decision in case of time constraints.

**5th Question: What do you hate about current movie rating sites (such as IMDb or Letterboxd)?**

Respondents expressed several concerns about existing platforms. Some of the common issues raised were biased or misleading ratings based on trends, hype, or certain communities, and the rigidity of single-rating systems, where opinions cannot be modified over time. Other interviewees did not like excessively long reviews, and others believed that cultural or genre bias affects the outcome (e.g. indie dramas getting more praise than blockbusters). In general, the primary disappointment was the absence of personalization, authenticity, and flexibility, which emphasizes the necessity of a platform that will be representative of personal taste and changing views.

**-Summary of key findings:**

Interviews showed that people usually choose what to watch based on their mood, with personal recommendations being more trusted than platform suggestions. All participants said rewatching a movie often changes their opinion, which supports having flexible rating options.

Everyone liked the idea of having a personal movie shelf to organize what they've watched or want to watch, especially since watchlists are currently spread across apps. Movie length only mattered when people were short on time, short films during weekdays, longer ones on weekends.

Lastly, users had issues with current rating platforms, such as biased scores and not being able to change ratings. They preferred a more personal and less rigid system.

### 3.1.2 Questionnaire

To gain a better understanding of our target audience and design a system that meets their expectations, we used a questionnaire to collect information and to determine the needs of the users. The sample selected was composed of the participants of various age groups, beginning with 16 years and above.

The survey was done online via Google Forms, and the link was shared on WhatsApp and other social networking sites to attract a wide range of people. Forty-two people answered the questionnaire. The questionnaire questions and answers are shown in [Appendix \[B\]](#) to discuss the movie watching habits of the users, their views on rewatching and rating, the significance of personal shelves and their dissatisfaction with the current movie rating systems. The questionnaire had 6 closed-ended questions and 1 open-ended question.

#### -Questionnaire Answers Result:

##### 1<sup>st</sup> question:

How often do you watch movies?  
43 responses

## 2<sup>nd</sup> question:

How do you typically discover new movies to watch?

43 responses

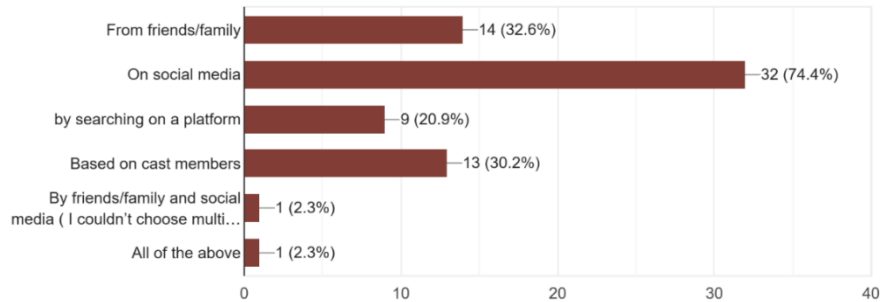

Figure 3: Questionnaire answers 2nd question

## 3<sup>rd</sup> question:

How important it is for you to keep a list or "shelf" of the movies you've watched with optional ratings?

43 responses

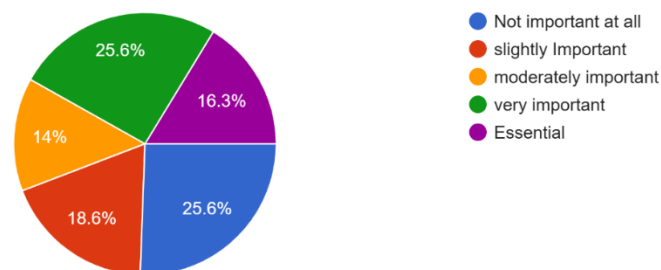

Figure 4: Questionnaire answers 3rd question

## 4<sup>th</sup> question:

How often do you re-watch movies you've seen before ?

43 responses

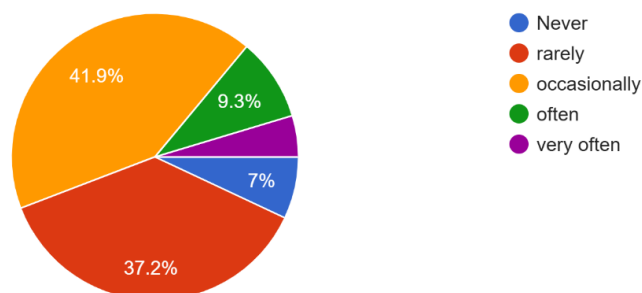

Figure 5: Questionnaire answers 4th question

### 5<sup>th</sup> question:

Did you ever change your opinion about a movie's rating after re-watching it?

43 responses

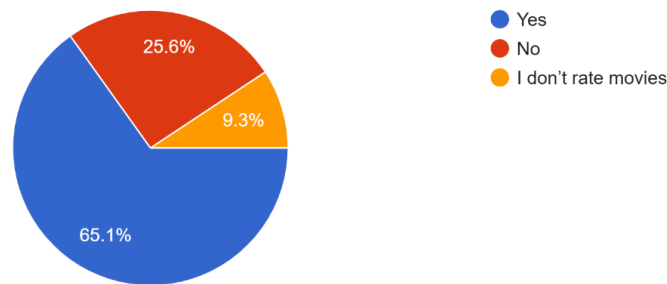

Figure 6: Questionnaire answers 5th question

### 6<sup>th</sup> question:

When you are short on time, how important is it to be able to find a movie that fits your available time (e.g., less than 90 minutes)?

43 responses

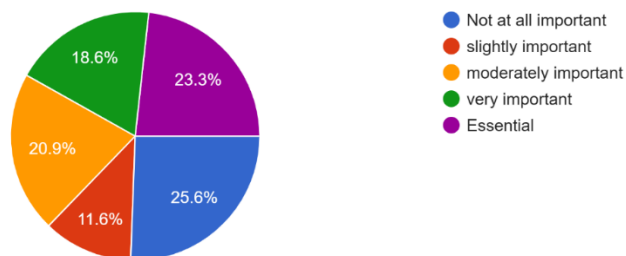

Figure 7: Questionnaire answers 6th question

### 7<sup>th</sup> question:

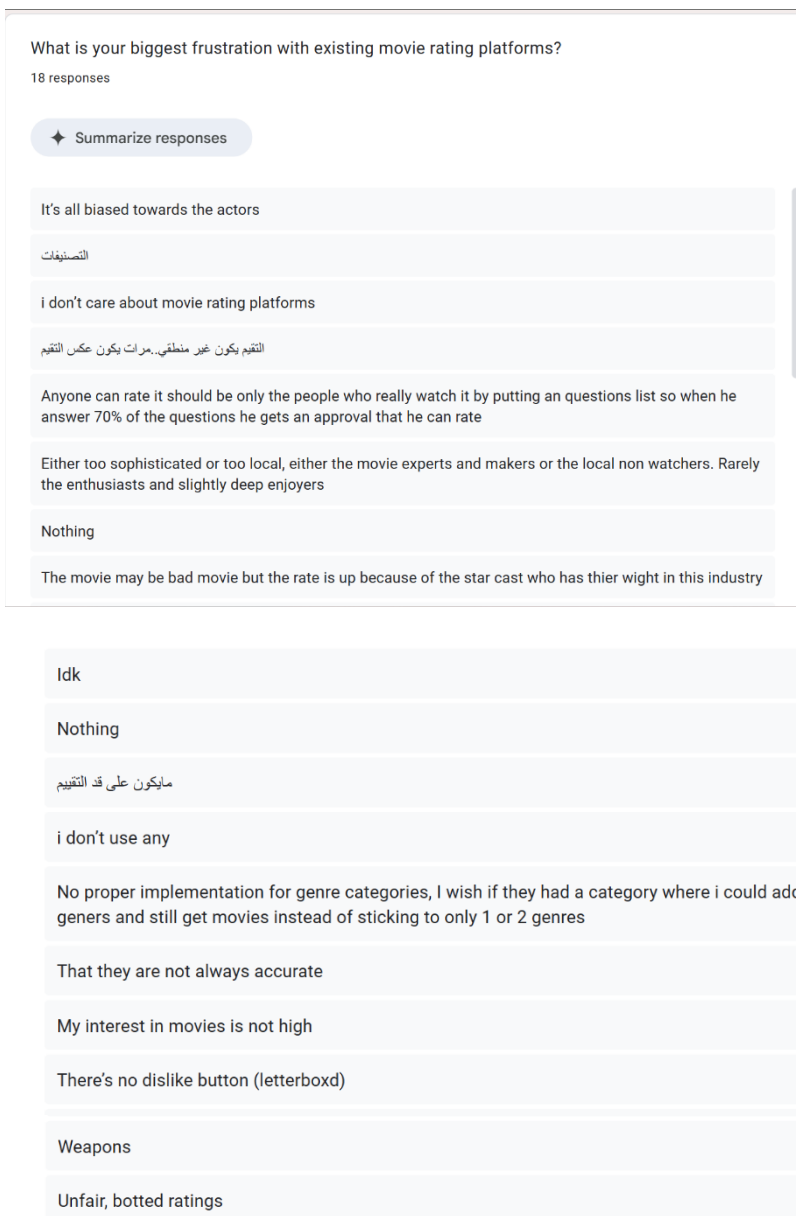

Figure 8: Questionnaire answers 7th question

### -Summary of key findings:

The questionnaire showed that most people watch movies often and usually rely on friends, social media, or favorite actors when choosing what to watch. Many participants said their opinions change after rewatching a movie, which supports the need for a rating system that allows multiple or editable ratings.

There was strong interest in having a personal shelf to organize favorite films or watch-later lists, as users feel current platforms don't offer enough customization. Movie length was also shown to matter, especially when users are short on time, making a runtime filter a useful feature.

Lastly, users were unhappy with existing rating platforms due to biased scores and lack of personalization. This highlights a demand for a more flexible and user-centered movie platform like StoryLense.

### 3.2 System Users

The StoryLense platform is developed for two primary user groups: movie enthusiasts and general consumers of film. The platform is designed to be accessible and intuitive for a broad audience to ensure the platform aligns and meets their requirements.

User characteristics and requirements include:

- **Demonstrated Interest:** Users should possess an interest in film and a willingness to engage with movie-related content. This includes a desire to rate films, write reviews, and explore new cinematic content.
- **Fundamental Technical Skills:** Users are expected to have a foundational understanding of web navigation and the use of digital applications. No advanced technical knowledge is required.
- **Broad Accessibility:** The platform is designed for a diverse user base, and there are no specific educational or age restrictions. The user experience prioritizes ease of use to accommodate individuals from various backgrounds.
- **Motivation:** Users are motivated by a desire to organize their viewing history, find film recommendations that fit their personal schedule. They also seek the ability to curate personal lists, such as a "favorites" collection or a "watch later" list, to keep track of content they want to revisit or discover.

### 3.3 Use Case Diagram

## 4 Chapter 4: System Design & Development

### 4.1 System Architecture

The system architecture defines how the main parts of the system work together and how data moves between them to achieve the main functions of the website, we decided to use the Client–Server Architecture for our system, as shown in Figure 4 This type of architecture divides the system into two main parts: the client side and the server side.

We chose the Client–Server Architecture for several reasons. First, it separates the presentation layer (the client) from the logic and data layer (the server and database). This makes the system easier to update, test, and maintain, as changes in one part do not affect the others. Second, it provides good scalability, allowing many users to connect and use the website at the same time. Third, it improves security by keeping all sensitive information stored safely on the server, rather than on the user's device.

The client side represents the user interface, which is designed using HTML, CSS, and JavaScript. It is responsible for interacting directly with users and providing them with a simple and attractive interface. Through the client side, users can perform actions such as creating an account, logging in and out, searching for movies, viewing movie details, rating films, and managing their personal shelves. The client sends user requests to the server through HTTP, then displays the received results on the screen in an organized and clear way.

The server side is the core of the system. It is developed using PHP and is responsible for processing all the requests coming from the client, applying the system's logic, and managing communication with the database. It handles important tasks such as verifying user information, adding or updating movie ratings, filtering search results based on duration, and keeping the users' data secure. The server connects to the MySQL database, which stores all permanent information such as user accounts, movie details, and rating records.

Overall, the Client-Server Architecture gives *StoryLense* a clear and organized structure. It allows efficient communication between the client, the server, and the database, which helps provide users with smooth and reliable experience when rating and exploring movies.

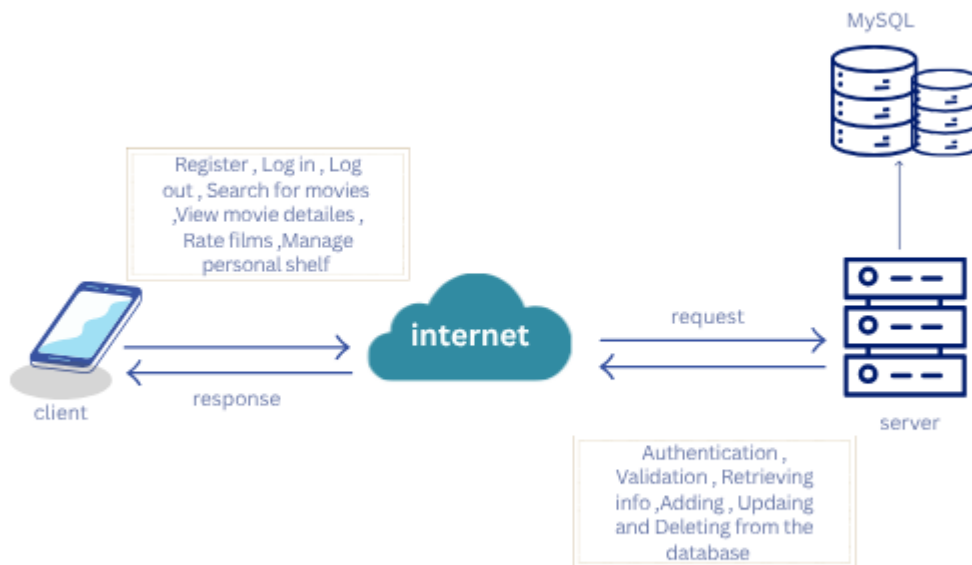

Figure 10: System Architecture Of StoryLense

## 4.2 Class Diagram

The class diagram provides a structural view of the system by illustrating the main classes, their attributes, methods, and how they are related. It serves as an essential part of the object-oriented design, helping to clarify how the system is decomposed into separate components and how these components work together to provide the required functionality. The diagram highlights the core classes of the

system, including **User**, **Admin**, **Movie**, **Shelf**, and **Rating**, and demonstrates how users interact with movies, submit ratings, and manage their personal movie shelf. This visual model supports the implementation phase by offering a clear blueprint of the system's architecture and its internal interactions.

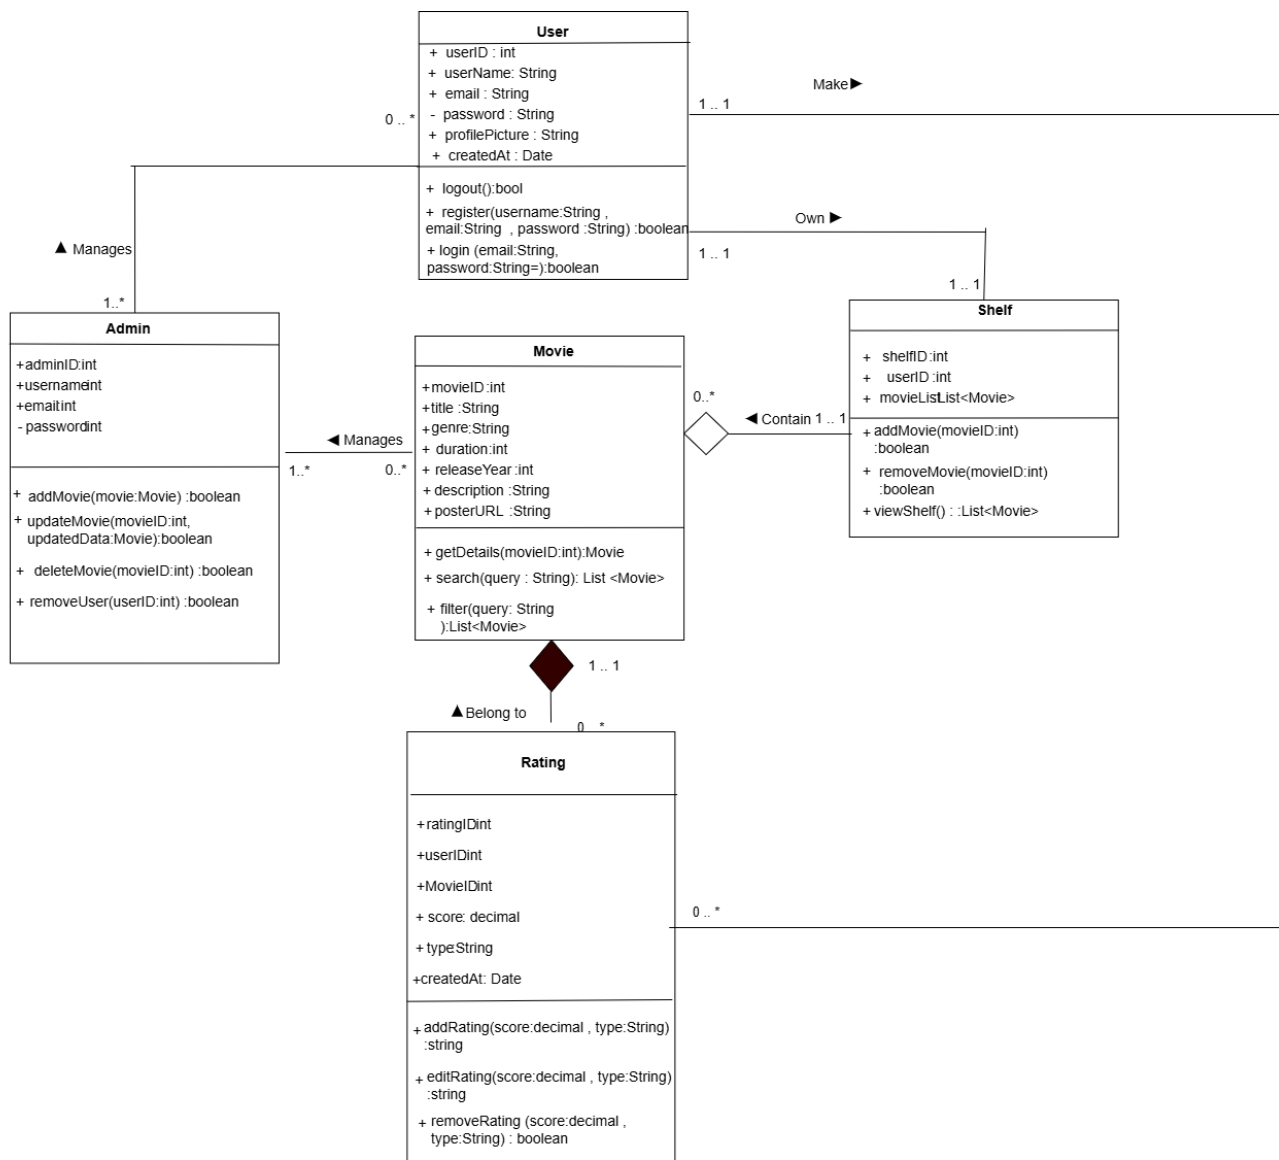

Figure 11:Class Diagram of StoryLense

### 4.3 Data Design

The data design defines how the system's information is organized, stored, and related in the database. It includes the Entity–Relationship Diagram (ERD), the relational schema, and the data dictionary.

The ER Diagram illustrates the main entities in the system and the relationships among them. This design ensures that data is stored efficiently, relationships are consistent, and user activities are properly linked.

- **Description of entities**

| Entity Name | Description                                                                             | Occurrence                                      |
|-------------|-----------------------------------------------------------------------------------------|-------------------------------------------------|
| User        | Represents any client using StoryLense to explore movies and provide ratings. Each user | A user can have one shelf and rate many movies. |

|        |                                                                                                                                          |                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
|        | can own one shelf and make multiple ratings.                                                                                             |                                                                                          |
| Admin  | Represents any admin who are responsible for managing website tasks such as adding/ editing/ deleting movies and removing users.         | An Admin is responsible for managing multiple movies and users.                          |
| Shelf  | Represents a user's personal collection of movies. It contains multiple movies that a user chooses to add by rating.                     | Each shelf belongs to one user and can contain many movies.                              |
| Movie  | Represents a film listed in the system with details such as title, genre, and description...etc.                                         | A movie can exist independently and can appear in many shelves and receive many ratings. |
| Rating | Represents a user's rating of a specific movie. It contains the rating value and the type of rating (for example, first watch/ rewatch). | Each rating belongs to one user and one movie.                                           |

Table 5: Description of entities

#### ○ Description of relationships

| Entity Name | Multiplicity | Relationship | Entity Name | Multiplicity |
|-------------|--------------|--------------|-------------|--------------|
| Admin       | 1 .. *       | Manages      | User        | 0 .. *       |
| Admin       | 1 .. *       | Manages      | Movie       | 0 .. *       |
| User        | 1 .. 1       | Owns         | Shelf       | 1 .. 1       |
| Shelf       | 0 .. *       | Contains     | Movie       | 0 .. *       |
| User        | 1 .. 1       | Make         | Rating      | 0 .. *       |
| Rating      | 0 .. *       | Belong to    | Movie       | 1 .. 1       |

#### 4.4 Component Design

In this section, we will look at our system's component design, focusing on the functionalities of Rate a movie and , Filter by Movie duration , and View movie details .We will give Activity Diagram and pseudocode for each user story, defining the logic and steps necessary for executing them.

- Rate a movie:

**Classification:** Function

**Definition:** The user should be able to Rate a movie either for the first time watcher or rerate a movie previously rated before.

- **Pseudocode:**

**METHOD** rateMovie(movieID: int, stars: int, note: string=""): Rating

**IF** stars < 1 **OR** stars > 5 **THEN**

**RETURN** "Invalid rating: must be between 1 and 5 stars"

**ENDIF**

**previousRatings** ← **getRatingsForMovie(movieID)**

**newRating** ← **Rating**(  
     **userID** = **self.userID**,  
     **movieID** = **movieID**,  
     **stars** = **stars**,  
     **note** = **note**,  
     **createdAt** = **CURRENT\_TIME**  
**)**

**IF previousRatings IS EMPTY THEN**

**addRating(self.userID, movieID, stars, note)**

**ELSE**

**newRating.isReRating** ← **TRUE**

**addRating(self.userID, movieID, stars, note)**

**ENDIF**

**avgStars** ← **calculateAverageStars(movieID)**

**ratingsCount** ← **countRatings(movieID)**

**updateMovieStats(movieID, avgStars, ratingsCount)**

**history** ← **getRatingsForMovie(movieID)**

**RETURN history**

**END METHOD**

- **Activity Diagram:**

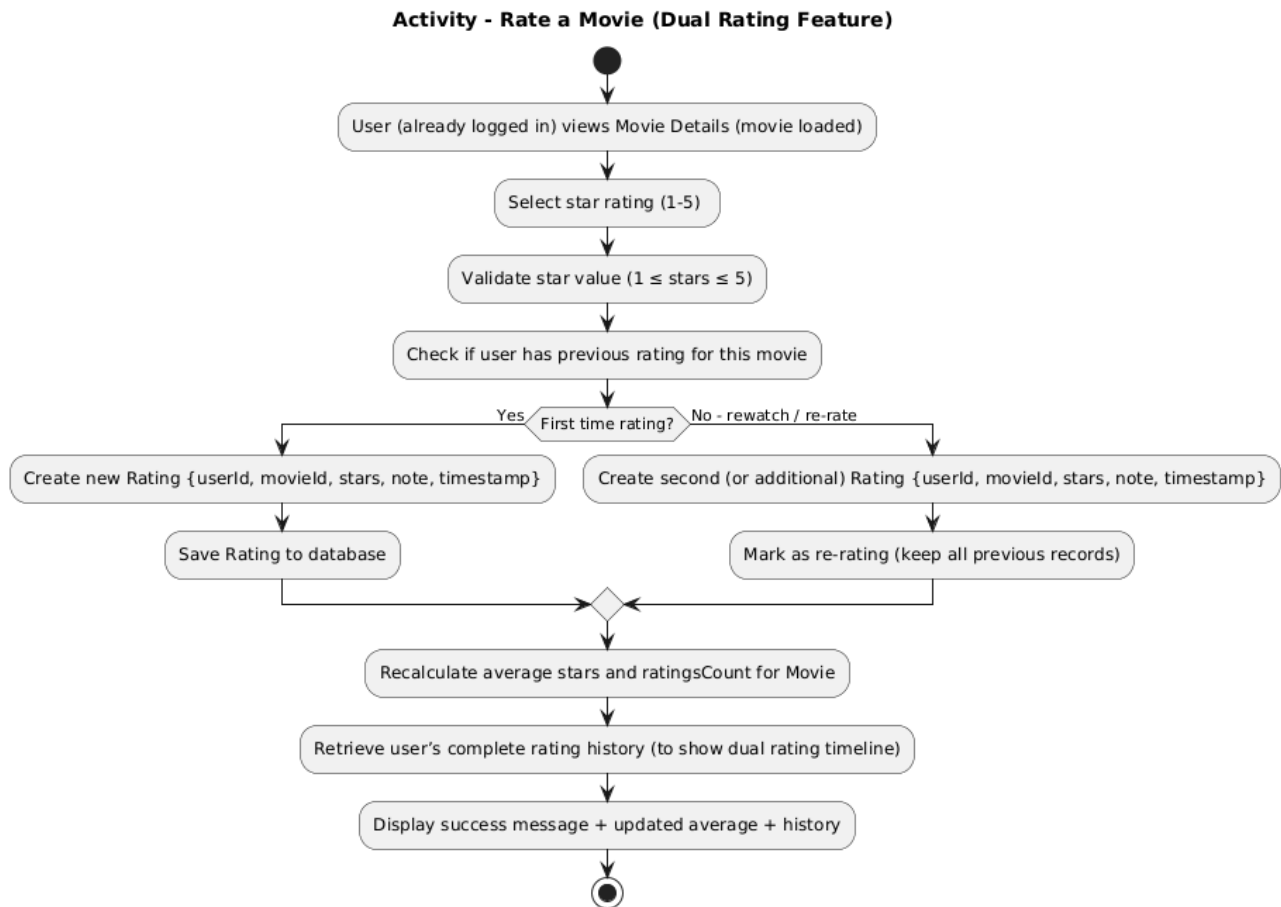

Figure 13:Activity Diagram of Rate A Movie Function

- Filter by duration :

**Classification:** Function

**Definition:** The user should be able to filter searched movies by duration to narrow down search results to match the user's chosen research output.

- **Pseudocode:**

**METHOD** searchByDuration(duration: string, genre: string, language: string):  
Movie[]

**IF** duration = "Short" **THEN**

```

    (min, max) ← (0, 60)
ELSE IF duration = "Medium" THEN
    (min, max) ← (61, 120)
ELSE IF duration = "Long" THEN
    (min, max) ← (121, 999)
ELSE
    (min, max) ← (0, 999)
ENDIF

results ← queryMovies(
    WHERE (title CONTAINS genre OR genre CONTAINS genre)
    AND duration BETWEEN min AND max
    AND language = language
)

IF results IS EMPTY THEN
    DISPLAY "No movies found"
ELSE
    DISPLAY results
ENDIF

RETURN results

END METHOD

```

- Activity Diagram:

**Activity - Search by Duration (Select Option with Fallback)**

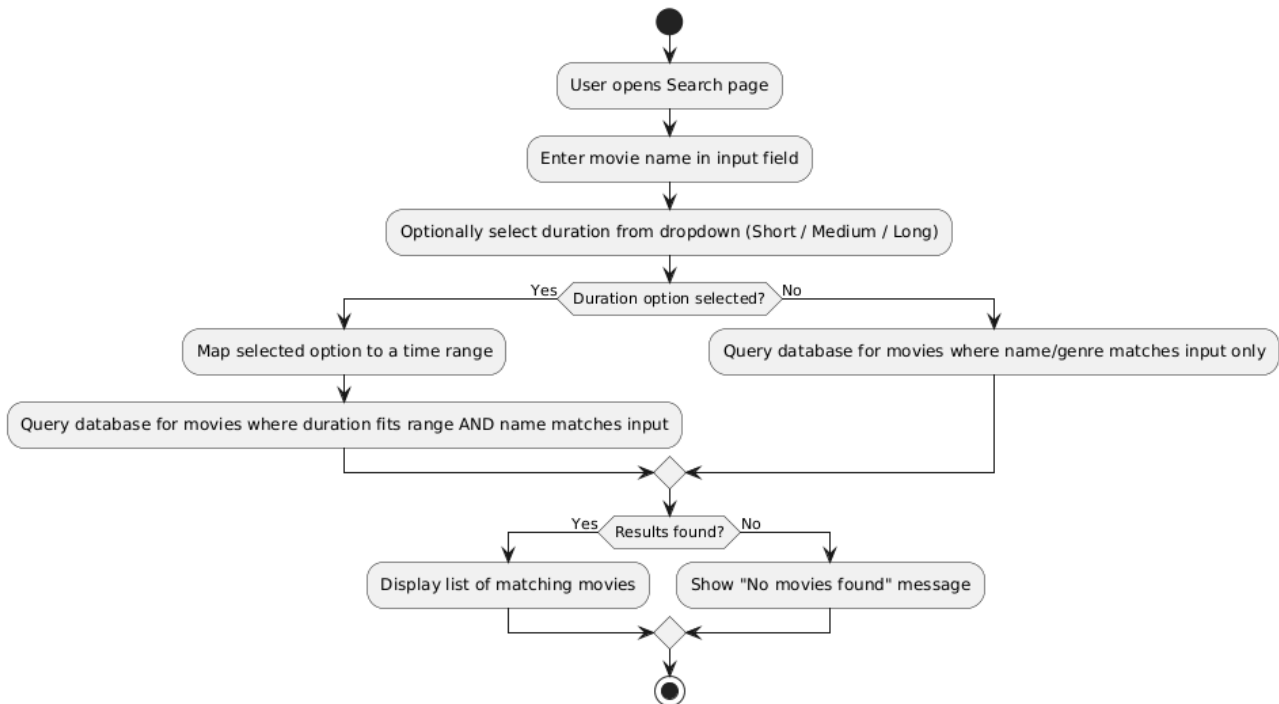

Figure 14:Activity Diagram of Search Filter Function

- View movie details:

**Classification:** Function

**Definition:** The user should be able to view movie details whenever they wish by clicking the desired movie on the "search" page.

- **Pseudocode:**

**METHOD** getDetails(movieID: int): Movie

```

movie ← queryMovieByID(movieID)
allRatings ← getRatingsByMovie(movieID)
avgStars ← calculateAverageStars(movieID)
  
```

**ratingsCount** ← **countRatings(movieID)**

**userRatings** ← **getRatingsByUserAndMovie(currentUserID, movieID)**

**IF** **userRatings** **IS NOT EMPTY** **THEN**

**DISPLAY** movie details + **userRatings** history

**ELSE**

**DISPLAY** movie details + "You haven't rated this movie yet"

**ENDIF**

**RETURN** movie

**END METHOD**

○ **Activity Diagram:**

## 4.5 Interface Design

The interface for StoryLense was designed with a focus on clarity, accessibility, and smooth user interaction. This section begins with a navigation diagram to illustrate the structure of the website and how users move between key pages during their journey.

- **Navigation map**

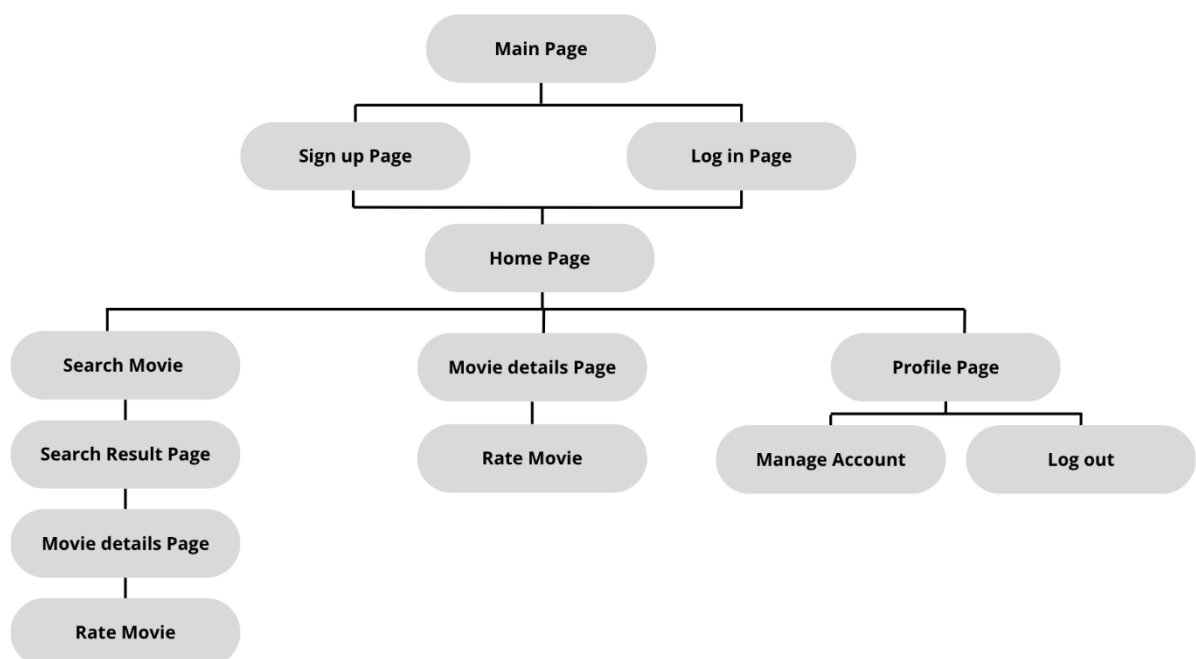

Figure 16: Navigation map of StoryLense

- **UX guidelines**

During the interface design process, we incorporated several UX principles to enhance usability and satisfaction:

### 1. **Consistency in Layout and Styling**

All pages maintain a uniform color scheme, and component positioning to avoid confusion and reinforce visual identity.

### 2. **Clear and Simple Navigation**

Using intuitive and easily recognizable navigation elements, to guide users to different sections or features of the website.

### 3. **Match Between System and Real World**

Language, icons, and workflows reflect real-world conventions and user expectations rather than technical jargon..

### 4. **Error Prevention and Feedback**

Input validations are implemented in forms like Login and Registration, and users receive immediate feedback when errors occur (e.g., empty field or invalid email).

### 5. **Minimal Cognitive Load**

Content is organized using simple sections and icons where appropriate; unnecessary information or steps are avoided to keep the interface simple.

### 6. **Recognition Rather Than Recall**

Interfaces rely on visible cues (menus, icons, autofill) so users don't have to remember information from one page to another.

### 7. **Responsive Design**

To enhance usability across devices, we implemented a fully responsive layout using CSS media queries. This ensures that the interface automatically adapts to different screen sizes—from desktops and laptops to tablets and mobile phones—while maintaining a consistent visual hierarchy and readability.

## 4.6 Implementation

The implementation phase focused on transforming the system design into a functional website that supports all core features of StoryLense. The front-end of the system was developed using HTML, CSS, and JavaScript to provide an interactive and responsive user interface. These technologies were selected for their flexibility, browser compatibility, and ability to deliver a clean and user-friendly experience.

User and movie data will be stored in a MySQL relational database, which was structured according to the data design described earlier in this report. Each table (User, Movie, Shelf, and Rating) was implemented with proper relationships and constraints to ensure data consistency and efficient retrieval.

By connecting the client interface with the database logic through PHP, the system enables users to register, log in, search for movies, rate them, and maintain a personal movie shelf. Although the database connection is not yet fully activated in this phase, all pages have been implemented with placeholders and form structures to support future backend integration. This approach allows the interface to function as a complete front-end prototype, ready for full database linkage in later iterations.

## 5 Chapter 5: System Evaluation

This chapter presents the evaluation of the StoryLense system to ensure that its features, design, and overall performance align with the requirements defined earlier in the project. The evaluation process focuses on verifying that the implemented functionalities work as intended, provide a smooth user experience, and meet the expectations of the target audience. Through structured acceptance testing and integration testing, we assess how well the system supports real user workflows, handles data accurately, and maintains usability across different scenarios. The findings in this chapter help determine the system's readiness and highlight areas for potential improvement in future iterations.

## 5.1 User Story Acceptance Testing

The User Story Acceptance Testing was done to ensure that every feature deployed in StoryLense is properly addressed to the user story and that it meets the acceptance criteria as outlined in the product backlog. This type of testing makes sure that the behavior of the system meets the functional expectations of the real users focusing on the usability, clarity and consistency of the entire platform.

It started with identifying all the user stories related to the core functionality of StoryLense, such as the creation of an account, authentication, search of movies, duration filtering, movie rating, shelf management, and multi-rating. Acceptance criteria were thoroughly reviewed and converted into test cases on a case-by-case basis to every user story. The individual test cases were aimed at testing visible behavior as seen through the eyes of the user, including how the system responds to valid and invalid input, system feedback, and proper data processing.

The interface that was implemented was tested with real user interactions. Testers were the representatives of the target audience, as outlined in our requirements analysis, and were given the task of doing certain things like registering an account, searching movies, rating them and managing their shelves. Their behavior was monitored to confirm that all acceptance criteria were achieved without misunderstanding, misjudgment, and further instructions. Successful outcomes, failures and notes were tabulated.

The results of the User Story Acceptance Testing are provided in the next section, and the pass/fail status and comments of each user story are provided. The experience of this testing helped us to assess the system readiness and make the necessary adjustments to enhance the general user experience and make sure that it corresponds to the project goals.

Table 12: Functional & Nonfunctional Requirements (Product Backlog)

| Sprint # | User Story | Acceptance Criteria | Test Case(s) | Pass | Comments |
|----------|------------|---------------------|--------------|------|----------|
|----------|------------|---------------------|--------------|------|----------|

|   |                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |  |

## 5.2 Integration Testing

To ensure that system components work together smoothly and follow the natural flow of user interaction, integration testing was performed using a structured hierarchy. This approach allowed us to verify each feature in the order it depends on other components, starting from user registration and progressing through search, filtering, viewing details, and rating movies. By integrating and testing modules incrementally, we ensured that data flows, navigation logic, and feature interactions were functioning correctly before introducing the next component. The following diagram and table summarize the integration hierarchy and the corresponding test cases used to validate the overall system behavior.

- Integration hierarchy diagram

- Integration testing plan

| System components        | New component        | Test case                              | Pass? | Comment |
|--------------------------|----------------------|----------------------------------------|-------|---------|
| - Register to the System | Log in to the system | 1- A user is registered in the system. | Yes   |         |

|                                                                                                       |                                               |                                                                                                                                                                                                                                                                                                                                                                            |     |  |

### 5.3 User Acceptance Testing

User Acceptance Testing (UAT) was conducted to evaluate whether the final version of StoryLense meets the expectations, needs, and usability requirements of real end users. While earlier testing focused on verifying functional requirements, UAT aims to assess the system from the user’s perspective—namely ease of use, clarity, responsiveness, and satisfaction with the implemented features.

To perform UAT, **10 participants** were recruited from the target audience defined in Phase 2, including university students, casual movie viewers, and film enthusiasts aged between 21 and 30. At the beginning of the session, each participant was asked for consent to provide their personal information and confirm their agreement to participate in the test ,before starting the test, participants were given a few minutes to explore the system freely, afterwards Participants were asked to complete core tasks such as registering an account, logging in, searching for movies, applying the duration filter, rating a movie multiple times, and managing their personal shelf. After interacting with the system, users completed a **10-item questionnaire** designed to measure their experience on a **5-point Likert scale** (1 = Strongly Disagree, 5 = Strongly Agree) Their feedback was gathered through a questionnaire consisting of 10 questions ([See Appendix B](#)), where they were asked to evaluate their experience ,The responses were later analyzed to identify usability problems and guide future enhancements.

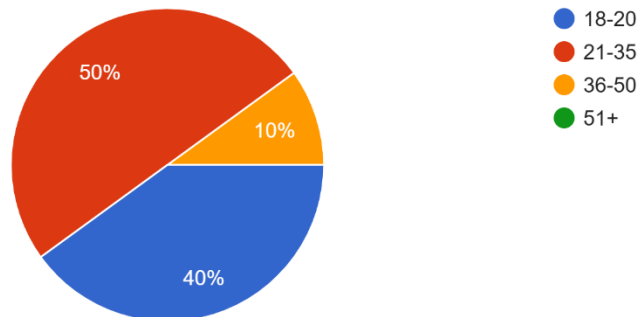

#### 5.3.1 Participants' Demographics

The ten participants who took part in the User Acceptance Testing (UAT) were recruited from the target audience defined in Phase 2 — young adults who frequently watch films and are active on digital platforms. The group represents a balanced mix of genders, age ranges, and technical skill levels, aligning with StoryLense's intended user base.

This mix ensured feedback from a diverse set of individuals and different usage patterns, The demographic results are summarized based on the chart as follows:

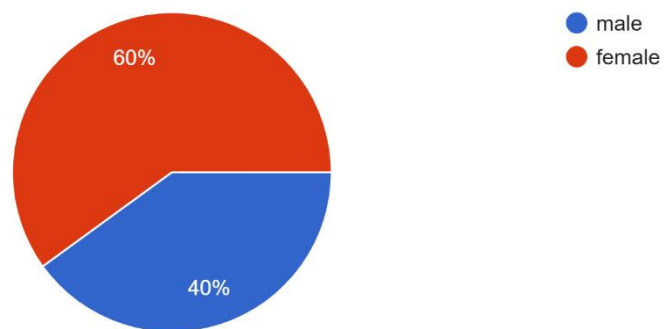

### participant's age:

10 responses

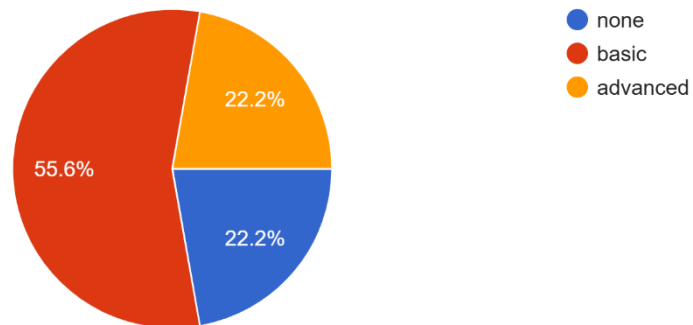

### paricipant's gender:

10 responses

### participant's Technical Experience:

9 responses

### Have you used similar websites before?

10 responses

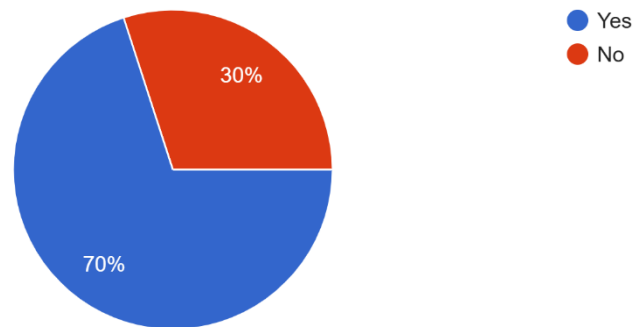

Figure 17: Demographic of acceptance testing participations

- **Gender Distribution**

According to the UAT demographic survey, **60 % of participants were female** and **40 % male**.

This proportion reflects a balanced gender composition and provides feedback from both perspectives of typical movie-platform users (*See Figure 17*)

.

- **Age Groups**

The largest group of participants (50 %) were between 21 and 35 years old, while 40 % were aged 18–20, and 10 % between 36 and 50.

This confirms that most testers belong to the young-adult demographic that StoryLense primarily targets — students and working professionals who actively consume media online.

(*See Figure 17.*)

- **Technical Experience**

When asked to rate their technical expertise:

- **55.6 % reported basic experience,**
- **22.2 % had advanced experience,** and
- **22.2 % reported no technical background.**

This distribution indicates that the system was tested by users across varying digital-skill levels, ensuring that usability was evaluated both by novice and experienced users.

(*See Figure 17*)

- **Previous Experience with Similar Platforms**

A majority (70 %) indicated that they had used similar movie-rating websites (such as IMDb or Letterboxd) before, while 30 % had no prior experience.

This mix provided valuable feedback from both experienced and first-time users — allowing the team to assess the learning curve and intuitiveness of StoryLense.

(*See Figure 17*)

### 5.3.2 Questionnaire Result

In this sub-section, a user-acceptance questionnaire was distributed to ten participants ([see Appendix B](#)). The purpose was to evaluate StoryLense's usability, interface clarity, system responsiveness, and overall satisfaction. Participants rated ten statements on a five-point Likert scale (1 = Strongly Disagree, 5 = Strongly Agree). The following points summarize and interpret the feedback obtained.

#### **Ease of Registration and Login**

All participants successfully created and logged into their accounts. 60 % strongly agreed and 30 % agreed that the process was easy and straightforward, while 10 % remained neutral. This demonstrates that StoryLense's authentication is simple and reliable, with minimal friction for new users.

#### **Navigation and Interface Clarity**

Every participant rated navigation positively: 60 % agreed and 40 % strongly agreed that the website is intuitive. These responses indicate that the overall structure, layout, and labels are clear and that users can locate content without confusion.

#### **Search and Filtering Functionality**

For movie-search functionality, 50 % strongly agreed and 40 % agreed that searching is simple and fast. When evaluating the duration filter, 80 % agreed it helped them find films suited to their available time, and 20 % strongly agreed. This confirms that the filter-by-duration feature fulfills its intended purpose and differentiates StoryLense from competitors.

#### **Movie Details Presentation**

Regarding the clarity of movie-information pages, 60 % strongly agreed, 30 % agreed, 10 % were neutral, and none disagreed. Participants described the information as complete and well-organized, although a few recommended adding more visuals such as posters or trailers.

## Dual-Rating Feature

The unique **Dual-rating system**, allowing users to rate a movie two separate times, was well received: 60 % agreed and 40 % strongly agreed that it was easy to understand and useful. Several participants commented that it accurately reflects how opinions change after rewatching—a validation of this core feature.

## Shelf Management and List Functions

When asked about adding or removing movies from their shelf, 60 % strongly agreed and 40 % agreed that the process was simple. This indicates that personal-list functionality is intuitive and performs as expected.

## Design and Visual Comfort

For interface design, 60 % agreed and 40 % strongly agreed that the platform is visually clean and comfortable to use. Participants appreciated the simple layout, consistent color palette, and readable text. No usability issues were reported.

## System Performance and Response Speed

System responsiveness received the highest praise: 70 % strongly agreed and 30 % agreed that the website responded quickly to their actions. No lag or delay was observed in searching, filtering, or rating tasks.

## Overall Satisfaction

Half of the participants (50 %) strongly agreed and the remaining 50 % agreed that they were satisfied with StoryLense overall. This complete absence of disagreement indicates strong user acceptance and that the product meets its usability objectives.

## Summary of Findings

The UAT results reveal consistently high satisfaction levels across all tested criteria, results confirm that StoryLense achieves high usability and aligns with user expectations.

### 5.4 Discussion

In this section, we interpret the results obtained from the previous testing phases. The following reflections summarize the effectiveness of the testing process, the design and development outcomes, and the insights gained from User Acceptance Testing.

- **Process Evaluation**

The testing process demonstrated that the system functions as intended.

- **User Story Acceptance Testing** showed that all features met their acceptance criteria, including registration, login, search, duration filtering, viewing movie details, rating (first-time and rerating), editing ratings, deleting ratings, adding/removing movies from the shelf, and the non-functional requirements.
- **Integration Testing** confirmed that when system components were combined, they worked together smoothly. Navigation between the system's main features—from logging in, searching, filtering, viewing details, rating, to managing the shelf—occurred without errors.
- **User Acceptance Testing** validated that the system is usable, functional, and clear from the user's perspective.

- **Design and Development Reflections**

The implemented system design supported the required functionalities effectively and provided an intuitive user experience. Users were able to navigate between key pages, interact with the rating system, and manage their shelf seamlessly. The consistent behavior across features and smooth execution flow reflect that the design and development choices aligned well with the project goals.

- **Results Interpretation (UAT & NFR)**

The results of the User Acceptance Testing were positive overall. Participants completed the assigned tasks successfully, which demonstrates that the system met its intended usability requirements. Furthermore, the tested non-functional requirements—such as performance, responsiveness, browser compatibility, security behaviors, and clarity of error messages—were satisfied based on the executed test cases.

No major issues were encountered during testing, indicating that the system performed reliably and as expected.

- **Areas for Improvement**

While the system performed well, certain enhancements can be considered for future development:

- **Performance Enhancements:** Further optimization can be applied to improve loading and processing time as the system scales.
- **Extended Features:** Additional filtering options or recommendation-based features can be explored to enrich user experience.
- **User Guidance:** Adding small hints or brief instructions on pages may help first-time users navigate the system even more smoothly.

Overall, the system evaluation results were strong and aligned with expectations. The implemented features worked correctly, users were able to complete tasks without difficulty, and the system demonstrated stability and usability across all testing phases

## 6 Chapter 6: Conclusion & Future Work Analysis

In this chapter, we summarize the “StoryLense” project’s key findings, impact, and overall contribution to enhancing the movie-rating experience. Additionally, we highlight potential directions for future development to further strengthen the system’s functionality and user experience.

### 6.1 Conclusion

In conclusion, the “StoryLense” project delivers a structured and user-centered movie rating platform that responds to the core issues raised in the introduction. While traditional platforms treat each viewing as a static event with a single rating and rigid watchlists, StoryLense acknowledges that film perception evolves over time and that users’ emotional responses, moods, and life experiences continuously reshape their opinions. By supporting dual ratings for first-time and repeat viewings, offering a duration-based search filter, and providing a dynamic shelf that grows with the user’s journey, the system transforms movie watching from a one-time interaction into an ongoing reflective experience.

Throughout the development process, the team followed the full software engineering lifecycle presented in this report: analyzing existing platforms and their limitations, gathering requirements through interviews and questionnaires, designing the system architecture, database, and interface, and finally implementing and testing the complete website. Along the way, challenges such as keeping the data flow consistent between features, designing intuitive navigation, and ensuring that the rating and shelf behaviors matched user expectations were addressed through iterative refinement and thorough testing.

Despite its strengths, the current version of StoryLense still has some limitations. The filtering options focus mainly on duration, social features such as following other users or public community reviews are not yet included, and the movie database is intentionally limited in size. These constraints, however, are known and documented, and they form a clear path for future enhancement rather than failures of the current system. The main contribution of this project is demonstrating that a movie rating platform can be designed around emotional growth, personalization, and self-reflection instead of static scores—bridging the gap between user data and human experience that was highlighted in the introduction.

Overall, StoryLense achieves its primary objectives: it offers users a more authentic way to document their changing relationship with films, supports more intentional time-based choices, and provides a foundation for richer personalization in the future.

In the next section, we outline potential extensions that can build on this foundation and further expand the system's impact.

## 6.2 Future Work

In this section, we outline several potential enhancements to further expand the capabilities of the “StoryLense” platform and improve the overall user experience. These enhancements aim to strengthen system functionality, increase personalization, and support long-term scalability.

### 1. Advanced Filtering & Personalized Browsing

- Introduce additional filtering options (e.g., genre, release year, popularity).
- Implement personalized movie suggestions based on user rating patterns and shelf behavior.

### 2. Enhanced Shelf Features

- Add categorization inside the shelf (e.g., “Favorites”, “Watch Later”, “Completed”).
- Allow users to sort their shelf based on rating, recency, or movie duration.

### 3. Social & Community Features

- Enable users to share their ratings or shelves with friends.
- Introduce optional public reviews or comments to encourage community engagement.

### 4. Mobile App Development

- Develop a mobile version of StoryLense to improve accessibility and allow users to interact with the platform on the go.
- Ensure full optimization across different screen sizes and devices.

### 5. Performance & Scalability Enhancements

- Improve system performance with larger datasets of movies and ratings.
- Optimize the database to support more users and quicker search responses.

By implementing these enhancements, StoryLense can continue to grow into a more comprehensive, engaging, and personalized movie-rating experience—offering users intuitive tools to discover films, express their preferences, and manage their viewing journey with ease and clarity

## 8 Appendix

### 8.1 Appendix (A): Interviews

- **Interview questions:**

1. How do you usually decide which movie to watch?
2. Have you ever felt that your opinion about a movie changed after watching it more than once and if so, could you clarify by giving an example?
3. Would you find it useful to have a personal shelf to save and organize your favourite or to-watch movies? Why or why not?
4. When choosing a movie, how important is the movie duration in your decision and would that reflect your decision?
5. What do you dislike about existing movie ratings platforms (like IMDb or Letterboxd) if you use any of them, and if you do not why?

- **Interviews' transcriptions:**

|                                                                                                                                                                      | role of recommendations and trailers, showing awareness of both personal preference and external influence in decision-making.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Question 2:</b><br>Have you ever felt that your opinion about a movie changed after watching it more than once and if so, could you clarify by giving an example? | <b>Answer:</b><br>Yes, that's happened to me.<br>For example, the movie A.I. Artificial intelligence the first time I watched it felt dreamy and peaceful but when I watched it again it felt kind of disturbing and uncomfortable, I guess I noticed different things the second time that changed how I felt about it.<br><br><b>Observation:</b><br>She reflected deeply on how her perception of a movie can change over time, providing a concrete example. Her answer showed attentiveness to detail and an ability to critically reassess her experiences. |
| <b>Question 3:</b><br>Would you find it useful to have a personal shelf to save and organize your favourite or to-watch movies? Why or why not?                      | <b>Answer:</b><br>Yes, I think that would be really useful. Having a space where I can organize my favourite movies and watchlist helps me express myself better and keep track of what I've watched or want to watch. It makes things more personal and easier to manage.<br><br><b>Observation:</b><br>She strongly supported the idea of a personal movie shelf, stressing both organization and self-expression. Her response revealed enthusiasm for features that combine practicality with personal identity.                                              |
| <b>Question 4:</b><br>When choosing a movie, how important is the movie duration in your decision and would that reflect your decision?                              | <b>Answer:</b><br>Personally, movie duration doesn't really influence my choice. If the plot sounds good or the trailer catches my interest, I will go for it regardless of how long it is                                                                                                                                                                                                                                                                                                                                                                        |

|                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                           | <b>Observation:</b><br>She made it clear that movie duration does not affect her decisions, focusing instead on story and overall appeal. Her response demonstrated a preference for meaningful content over convenience.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Question 5:</b><br>What do you dislike about existing movie ratings platforms (like IMDb or Letterboxd) if you use any of them, and if you do not why? | <b>Answer:</b><br>From my experience with Letterboxd, one thing I didn't like is how a lot of people seem to add movies to their watchlist or rate them just because they're trending or everyone else is watching them. It sometimes feels like people are forcing themselves to watch things that don't really match their taste or personality.<br><br><b>Observation:</b><br>She expressed concern about inauthentic behavior on existing platforms, noting the impact of trends on user choices. Her response highlighted a desire for genuine engagement and independence in ratings. |

| <p><b>Question 1:</b><br/>How do you usually decide which movie to watch?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p><b>Answer:</b><br/>I usually check online reviews and ratings. Sometimes I follow specific directors I like, and if they release something new, I watch it. Other times, I just see what's trending on Netflix or get recommendations from friends</p> <p><b>Observation:</b><br/>The interviewee relies on both professional reviews and social recommendations. He showed that trust in familiar sources (directors/friends) and convenience (platform trends) guide his choices</p> |
| <p><b>Question 2:</b><br/>Have you ever felt that your opinion about a movie changed after watching it more than once and if so, could you clarify by giving an example?</p>                                                                                                                                                                                                                                                                                                                                                           | <p><b>Answer:</b><br/>Yes, that has happened. For example, when I first watched <i>Interstellar</i>, I thought it was too long and confusing. But after rewatching, I understood the themes better and appreciated the emotional depth. Now I consider it one of the best films I've seen</p>                                                                                                                                                                                             |

|                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                      | <p><b>Observation:</b></p> <p>He emphasized how repeated exposure can improve appreciation. His reflection shows that complex narratives may require multiple viewings for full understanding</p>                                                                                                                                                                                                                                                     |
| <p><b>Question 3:</b></p> <p>Would you find it useful to have a personal shelf to save and organize your favourite or to-watch movies? Why or why not?</p>           | <p><b>Answer:</b></p> <p>Yes, absolutely. I always forget movie titles that people recommend to me. Having a personal shelf would keep everything organized and save me time when I'm choosing what to watch.</p> <p><b>Observation:</b></p> <p>The interviewee expressed clear interest in organizational tools, highlighting forgetfulness as a pain point. This suggests strong demand for a personalized feature that stores recommendations.</p> |
| <p><b>Question 4:</b></p> <p>When choosing a movie, how important is the movie duration in your decision and would that reflect your decision?</p>                   | <p><b>Answer:</b></p> <p>It depends on my schedule. If I'm busy, I prefer short films or episodes. On weekends, I don't mind longer movies, even if they're 3 hours, as long as the plot sounds interesting.</p> <p><b>Observation:</b></p> <p>His decision-making is situational. He values flexibility and time management, showing that movie length only becomes important when he is pressed for time.</p>                                       |
| <p><b>Question 5:</b></p> <p>What do you dislike about existing movie ratings platforms (like IMDb or Letterboxd) if you use any of them, and if you do not why?</p> | <p><b>Answer:</b></p> <p>I feel that ratings can sometimes be misleading because they're influenced by hype or fan groups. Also, the recommendations don't always match my personal taste..</p> <p><b>Observation:</b></p> <p>He raised concerns about bias and lack of personalization. His feedback shows a need for more authentic and tailored</p>                                                                                                |

| <b>General Observations:</b> interviewee showed good engagement and responded positively to the questions. Her answers were balanced and reflected her interest in the topic of discussion.                                                                                |                                                                                                                                                                                                         |
| <b>Unsolved issues, Topics not covered:</b> All the required topics were addressed, and we obtained useful insights that can support the final results.                                                                                                                    |                                                                                                                                                                                                         |
| <b>Interviewee:</b> sara alotaibi                                                                                                                                                                                                                                          | <b>Date:</b> 1 <sup>th</sup> Oct 2025                                                                                                                                                                   |
| <b>Questions:</b>                                                                                                                                                                                                                                                          | <b>Notes:</b>                                                                                                                                                                                           |
| <b>Question 1:</b><br>How do you usually decide which movie to watch?                                                                                                                                                                                                      | <b>Answer:</b><br>I choose the movie based on my mood and the genre I feel like, and sometimes I check ratings or ask friends for recommendations.<br><br><b>Observation:</b>                           |

|                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                              | <p>The interviewee indicated that her movie choices are directly influenced by her mood. She also mentioned relying on ratings and friends' opinions as supporting factors, reflecting a balance between personal preference and external influence.</p>                                                                                                                                                                                               |
| <p><b>Question 2:</b><br/>Have you ever felt that your opinion about a movie changed after watching it more than once and if so, could you clarify by giving an example?</p> | <p><b>Answer:</b><br/>Yes, many times my opinion changes after rewatching, as I notice more details and appreciate the movie differently.</p> <p><b>Observation:</b><br/>Her response showed that rewatching gives her a new perspective on the movie, as she notices additional details that change her previous evaluation. This highlights her critical awareness and ability to reassess her experiences.</p>                                      |
| <p><b>Question 3:</b><br/>Would you find it useful to have a personal shelf to save and organize your favourite or to-watch movies? Why or why not?</p>                      | <p><b>Answer:</b><br/>Yes, because it helps me organize my favorite movies and the ones I want to watch easily.</p> <p><b>Observation:</b><br/>The interviewee expressed clear interest in the idea of having a personal movie shelf, considering it a practical tool for organizing and tracking her cinematic interests. This reflects her desire for easier access to her favorite content.</p>                                                     |
| <p><b>Question 4:</b><br/>When choosing a movie, how important is the movie duration in your decision and would that reflect your decision?</p>                              | <p><b>Answer:</b><br/>It's important. If I don't have much time, I prefer shorter movies, but during free time I don't mind watching longer ones.</p> <p><b>Observation:</b><br/>She explained that movie duration is an influential factor in her choices. She prefers shorter films when time is limited, while being more flexible with longer ones during free time. This demonstrates that her decisions are practical and context-dependent.</p> |

|                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Question 5:</b><br>What do you dislike about existing movie ratings platforms (like IMDb or Letterboxd) if you use any of them, and if you do not why? | <b>Answer:</b><br>They only allow one fixed rating and don't let me change my opinion after rewatching.<br><br><b>Observation:</b><br>The interviewee expressed dissatisfaction with current rating systems, as they do not allow flexibility to adjust opinions after a second viewing. This shows her desire for more dynamic and personalized evaluation tools. |

| Questions:                                                                                                                                                           | Notes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Question 1:</b><br>How do you usually decide which movie to watch?                                                                                                | <b>Answer:</b><br>I primarily rely on trusted peer recommendations from a few friends on Letterboxd, which acts as my 'human filter.' I also factor in my current mood and a movie's cultural buzz. I only browse streaming service 'New Releases' as a last resort.<br><br><b>Observation:</b><br>The interviewee utilizes a specific platform (Letterboxd) and a small, trusted peer group as a primary decision mechanism, prioritizing human trust over algorithms. Showed a blend of internal (mood) and external (buzz) influence. |
| <b>Question 2:</b><br>Have you ever felt that your opinion about a movie changed after watching it more than once and if so, could you clarify by giving an example? | <b>Answer:</b><br>Yes, my opinion completely flipped on the Coen Brothers' "A Serious Man." The first time, I found it frustrating and bleak. The second time, I finally understood the film's intent as a brilliant, existential black comedy, which completely changed my view.<br><br><b>Observation:</b><br>Provided a strong, specific example where a second viewing led to a complete reinterpretation of the film's genre and philosophical intent, demonstrating a high level of critical engagement and attention to detail.   |
| <b>Question 3:</b><br>Would you find it useful to have a personal shelf to save and organize your favourite or to-watch movies? Why or why not?                      | <b>Answer:</b><br>Incredibly useful. My main frustration is organization fatigue from having my 'watchlists' scattered across multiple streaming platforms (Netflix, HBO, etc.). A single 'meta-watchlist' would centralize my ideas and allow for personalized categories.<br><br><b>Observation:</b><br>Strongly supported the "personal shelf" idea, identifying the core pain point as cross-platform list fragmentation. Emphasized the desire for a centralized,                                                                   |

|                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                           | customizable management tool to reduce decision friction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Question 4:</b><br>When choosing a movie, how important is the movie duration in your decision and would that reflect your decision?                   | <b>Answer:</b><br>It's a critical factor that dictates the <i>timing</i> of my viewing. During the week, I have a hard limit of about 105 minutes for a spontaneous watch. Anything longer gets pushed to a dedicated weekend slot. Duration reflects the time commitment, not the quality.<br><b>Observation:</b><br>Defined movie duration as a practical barrier linked to a daily schedule. Set a clear, specific time boundary (105 minutes) that separates spontaneous weeknight viewing from planned weekend viewing, indicating context-dependent decision-making. |
| <b>Question 5:</b><br>What do you dislike about existing movie ratings platforms (like IMDb or Letterboxd) if you use any of them, and if you do not why? | <b>Answer:</b><br>I use Letterboxd, but I dislike the community groupthink and cultural signaling. The platform's overall rating is often skewed toward arthouse and indie dramas, unfairly marking down genuinely excellent blockbusters or crowd-pleasers.<br><b>Observation:</b><br>Expressed a sophisticated criticism of existing platforms, pointing out the bias and social dynamics in niche rating communities. Highlighted that ratings often reflect a specific aesthetic preference rather than broad quality.                                                 |

| <b>Question 1:</b><br>How do you usually decide which movie to watch?                                                                                                                                                                                                      | <b>Answer:</b><br>I usually check recommendations from friends first, because I like knowing if someone with similar taste enjoyed it. If not, I'll scroll through trailers on YouTube or platforms like Netflix until something feels appealing. My mood also matters a lot—if I'm tired, I go for something light, but if I'm in the mood to think, I'll pick something more dramatic.<br><b>Observation:</b><br>The interviewee highlighted the importance of both personal mood and external recommendations. She balanced between social influence |

|                                                                                                                                                                      | (friends' opinions) and individual preference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Question 2:</b><br>Have you ever felt that your opinion about a movie changed after watching it more than once and if so, could you clarify by giving an example? | <b>Answer:</b><br>Yes, definitely. For example, the movie <i>Interstellar</i> . The first time I watched it, I found it very confusing and overwhelming. But the second time, I understood it more, and I actually loved how emotional and meaningful it was. My perspective changed because I noticed details I missed at first.<br><b>Observation:</b><br>Her answer showed a reflective attitude and emphasized how rewatching can deepen understanding. She provided a clear example to illustrate her point. |
| <b>Question 3:</b><br>Would you find it useful to have a personal shelf to save and organize your favourite or to-watch movies? Why or why not?                      | <b>Answer:</b><br>Yes, I would. It helps me keep track of what I've already watched and what I still want to watch. I sometimes forget about movies I wanted to see, so a personal shelf would save me time and keep everything in one place.manage.<br><b>Observation:</b><br>She clearly expressed the practical benefit of organization, while also pointing out the problem it would solve for her—forgetting about movies.                                                                                   |
| <b>Question 4:</b><br>When choosing a movie, how important is the movie duration in your decision and would that reflect your decision?                              | <b>Answer:</b><br>It does play a role for me. If I don't have much time or it's late at night, I prefer shorter movies. But if it's the weekend, I don't mind a long one as long as the story looks good.<br><b>Observation:</b><br>Her response showed flexibility. Duration is not the main factor, but it does influence her depending on context and available time.                                                                                                                                          |
| <b>Question 5:</b><br>What do you dislike about existing movie ratings platforms (like IMDb or Letterboxd) if you use any of them, and if you do not why?            | <b>Answer:</b><br>I use IMDb sometimes, but I don't like how the ratings can feel biased. Some movies get really high scores just because they're popular, even if they aren't that great. I also think the reviews can be too long—I'd prefer a simple, short summary.                                                                                                                                                                                                                                           |

|  |                                                                                                                                                                                                       |
|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Observation:</b><br>She expressed skepticism about the reliability of ratings and mentioned a preference for concise reviews. This highlights a desire for more authentic and accessible feedback. |
|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 8.2 Appendix (B): Questionnaires

### 8.2.1 Requirements Gathering Questionnaire

- Questionnaires questions:**

- How often do you watch movies?
  - ☐ Never
  - ☐ Rarely
  - ☐ Occasionally
  - ☐ Often
  - ☐ Very Often
- How do you typically discover new movies to watch?
  - ☐ From friends/family
  - ☐ On social media
  - ☐ By searching on a platform
  - ☐ Based on cast members
  - ☐ Other (please specify)
- How important is it for you to keep a list or "shelf" of the movies you've watched with optional ratings?
  - ☐ Not important at all
  - ☐ Slightly important
  - ☐ Moderately Important
  - ☐ Very important
  - ☐ Essential
- How often do you re-watch movies you've seen before?
  - ☐ Never
  - ☐ Rarely
  - ☐ Occasionally
  - ☐ Often
  - ☐ Very Often

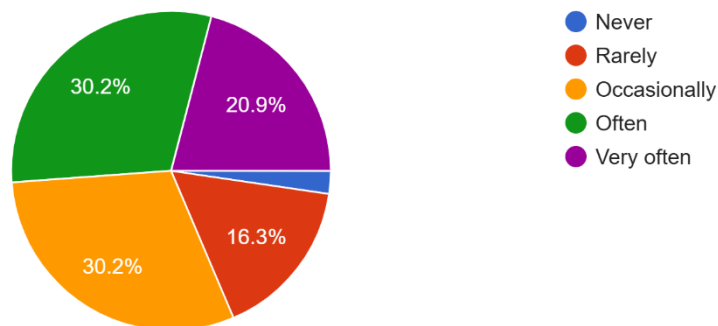

5. Did you ever change your opinion about a movie's rating after re-watching it?
  - ☐ Yes
  - ☐ No
  - ☐ I don't rate movies
  
6. When you're short on time, how important is it to be able to find a movie that fits your available time (e.g., less than 90 minutes)?
  - ☐ Not important at all
  - ☐ Slightly important
  - ☐ Moderately Important
  - ☐ Very important

7. What is your biggest frustration with existing movie rating platforms? (Open question)

• **Questionnaires answers:**

**1<sup>st</sup> question:**

How often do you watch movies?

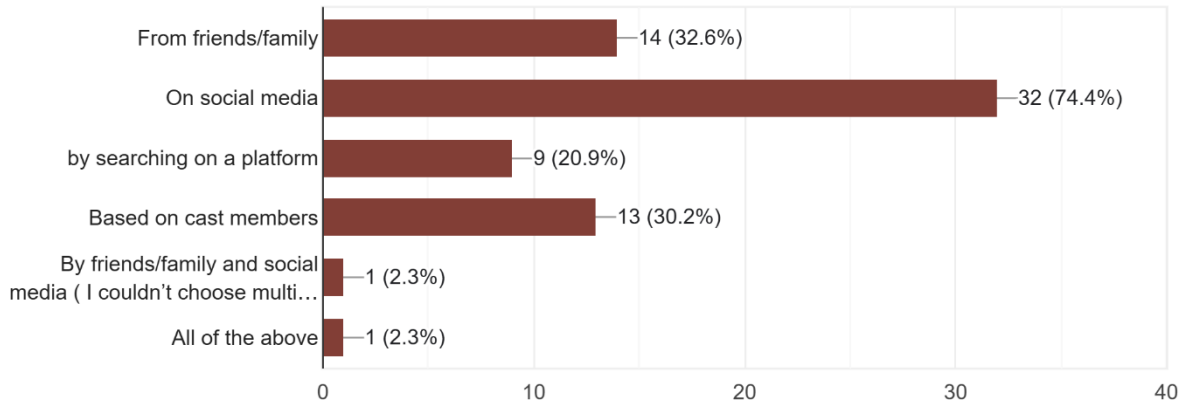

43 responses

**2<sup>nd</sup> question:**

### How do you typically discover new movies to watch?

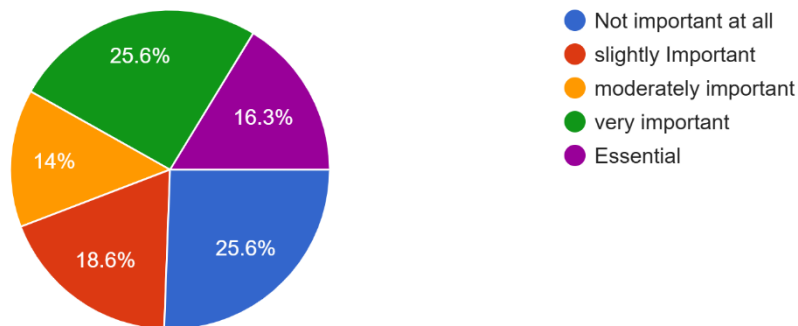

43 responses

### 3<sup>rd</sup> question:

How important it is for you to keep a list or “shelf” of the movies you’ve watched with optional ratings?

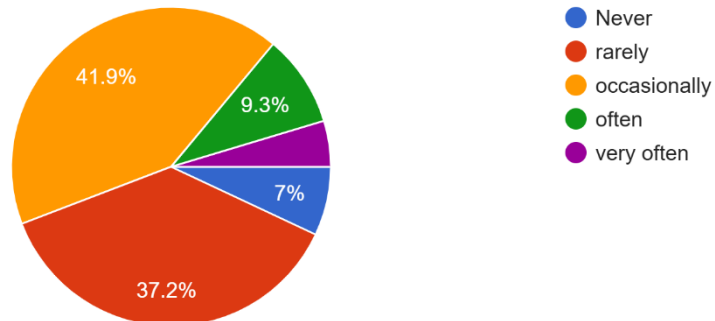

43 responses

### 4<sup>th</sup> question:

How often do you re-watch movies you've seen before ?

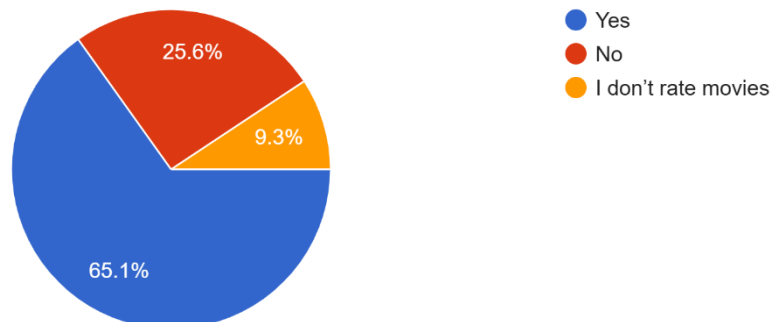

43 responses

5<sup>th</sup> question:

Did you ever change your opinion about a movie's rating after re-watching it?

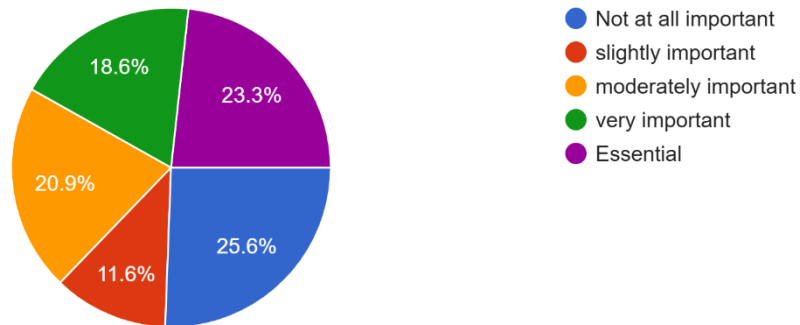

43 responses

6<sup>th</sup> question:

When you are short on time, how important is it to be able to find a movie that fits your available time (e.g., less than 90 minutes)?

43 responses

7<sup>th</sup> question:

What is your biggest frustration with existing movie rating platforms?

18 responses

◆ Summarize responses

It's all biased towards the actors

التصنيفات

i don't care about movie rating platforms

التقييم يكون غير منطقي..مرات يكون عكس التقييم

Anyone can rate it should be only the people who really watch it by putting an questions list so when he answer 70% of the questions he gets an approval that he can rate

Either too sophisticated or too local, either the movie experts and makers or the local non watchers. Rarely the enthusiasts and slightly deep enjoyers

Nothing

The movie may be bad movie but the rate is up because of the star cast who has thier wight in this industry

Idk

Nothing

مايكون على قد التقييم

i don't use any

No proper implementation for genre categories, I wish if they had a category where i could add many genres and still get movies instead of sticking to only 1 or 2 genres

That they are not always accurate

My interest in movies is not high

There's no dislike button (letterboxd)

Weapons

Unfair, botted ratings

## 8.2.2 Usability Testing Questionnaire

- **Questionnaires questions:**

1. The registration and login process was easy and straightforward.

- ☐ 1
- ☐ 2
- ☐ 3
- ☐ 4
- ☐ 5

2. The website's navigation was clear and intuitive.

- ☐ 1
- ☐ 2
- ☐ 3
- ☐ 4
- ☐ 5

### 8.3 Appendix (C): Jira

This appendix outlines the application of Jira, a popular project management tool, within our project workflow. Jira provides an extensive platform for managing tasks, monitoring progress, and facilitating team collaboration. This section emphasizes a crucial component of Jira: the Product Backlog. It functions as a dynamic, prioritized inventory of tasks intended for completion.
